Author	Dave Glover , Microsoft Cloud Developer Advocate
Platforms	Linux, macOS, Windows, Raspbian Buster
Services	Azure IoT Central
Tools	Visual Studio Code
Hardware	Raspberry Pi, Raspberry Pi Sense HAT
Language	Python
Date	September, 2019

PDF Lab Guide

You may find it easier to download and follow the PDF version of the **Raspberry Pi, Python, Azure IoT Central, and Docker Container Debugging** PyLab.

- [English Lab Guide](#)
- [?体中文??室指南](#)

PyLab Content

- [PyLab 1: Raspberry Pi, Debugging a Python Internet of Things Application](#)
- [PyLab 2: Raspberry Pi, Azure IoT Central, and Docker Container Debugging](#)

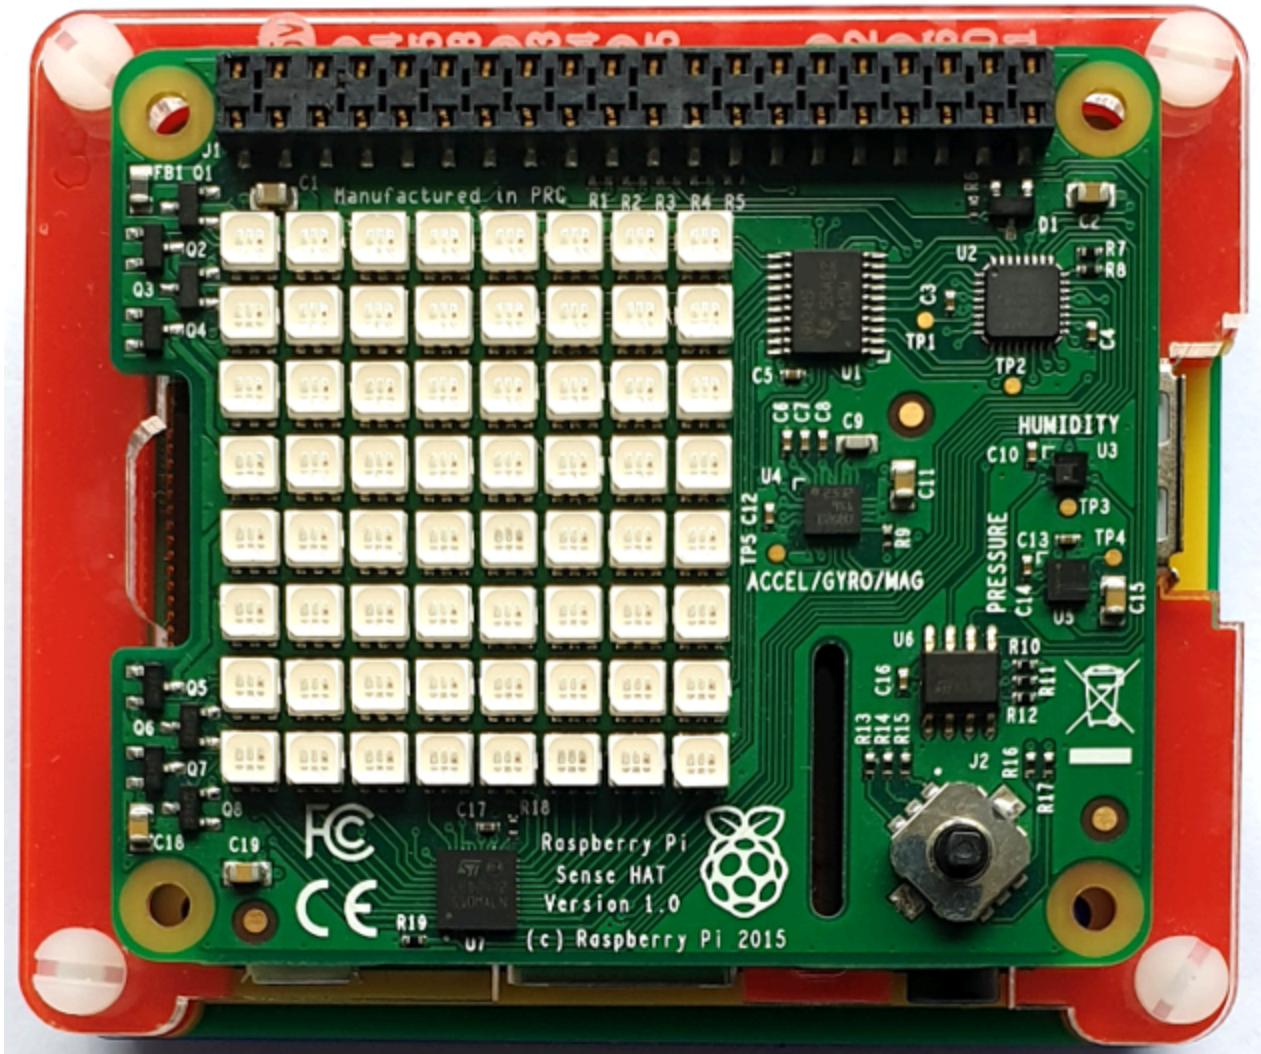

Introduction

In this hands-on lab, you will learn how to create a Python Internet of Things (IoT) application with [Visual Studio Code](#). Run the application in a Docker Container on a Raspberry Pi, read temperature, humidity, and air pressure telemetry from a sensor, and finally debug the application running in the Docker Container.

PyLab Set Up

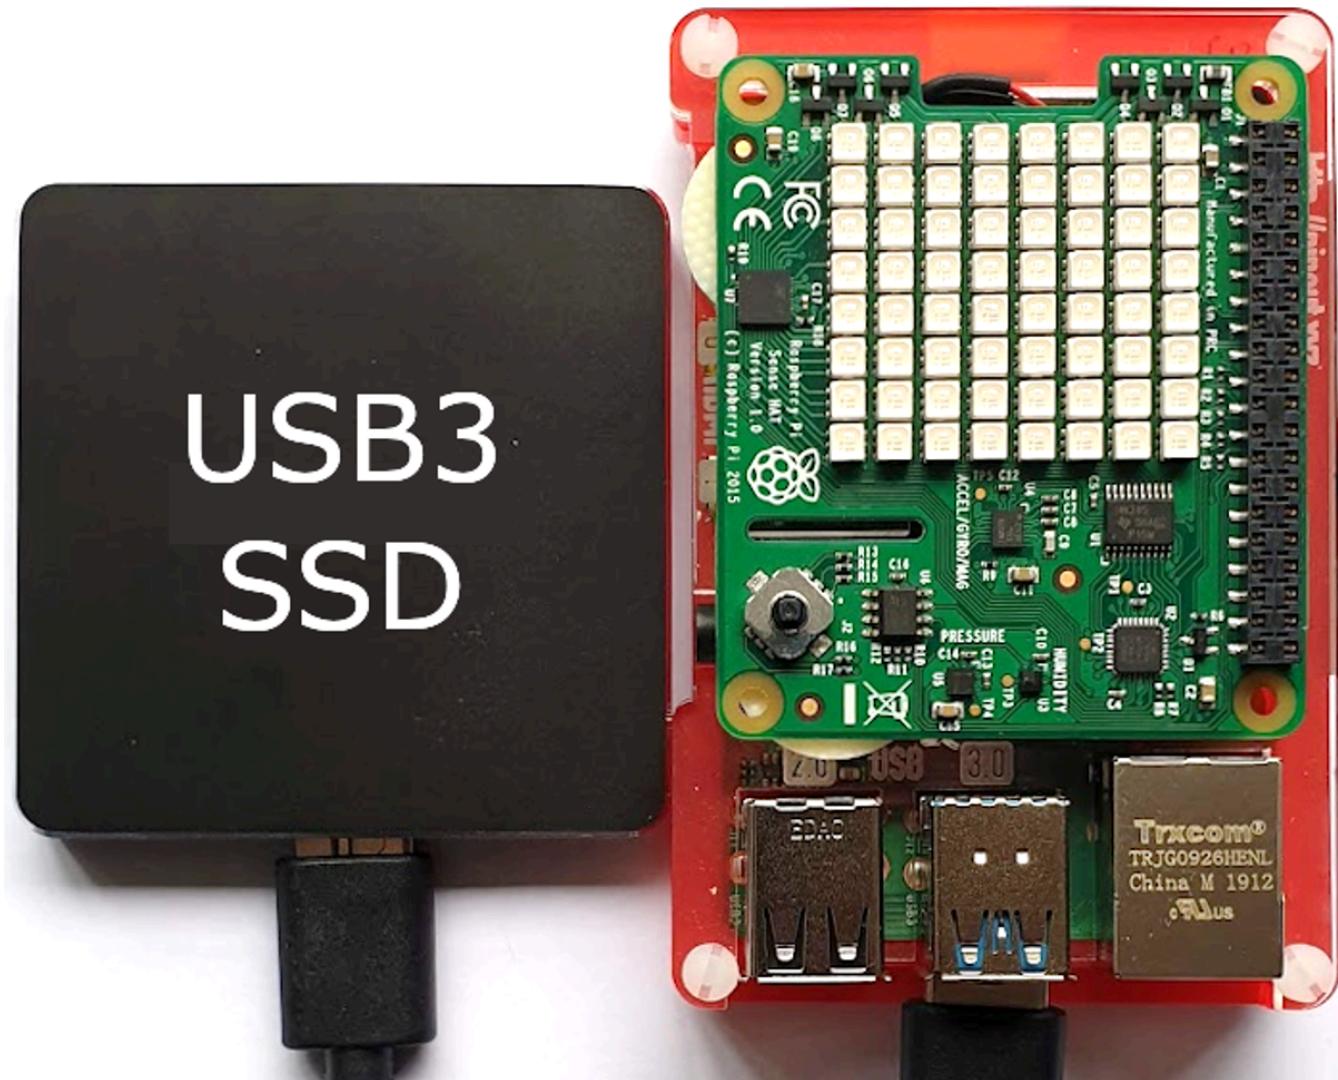

- [Single-User Set Up](#)

This automated set up installs the required libraries, Docker, and builds the lab docker images.

- [Multi-User Set Up](#)

The Multi-user set up allows up to 20 users/students per Raspberry Pi 4 4GB. A USB3 SSD drive is required to support the disk IO requirements for this number of users. The installation script installs the lab content, and Docker. Builds the lab Docker Images, and sets up all the users.

Software Installation

This hands-on lab uses Visual Studio Code. Visual Studio Code is a code editor and is one of the most popular **Open Source** projects on [GitHub](#). It runs on Linux, macOS, and Windows.

Install Visual Studio Code

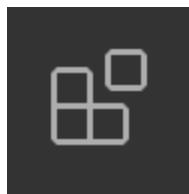

1. Install Visual Studio Code

Visual Studio Code Extensions

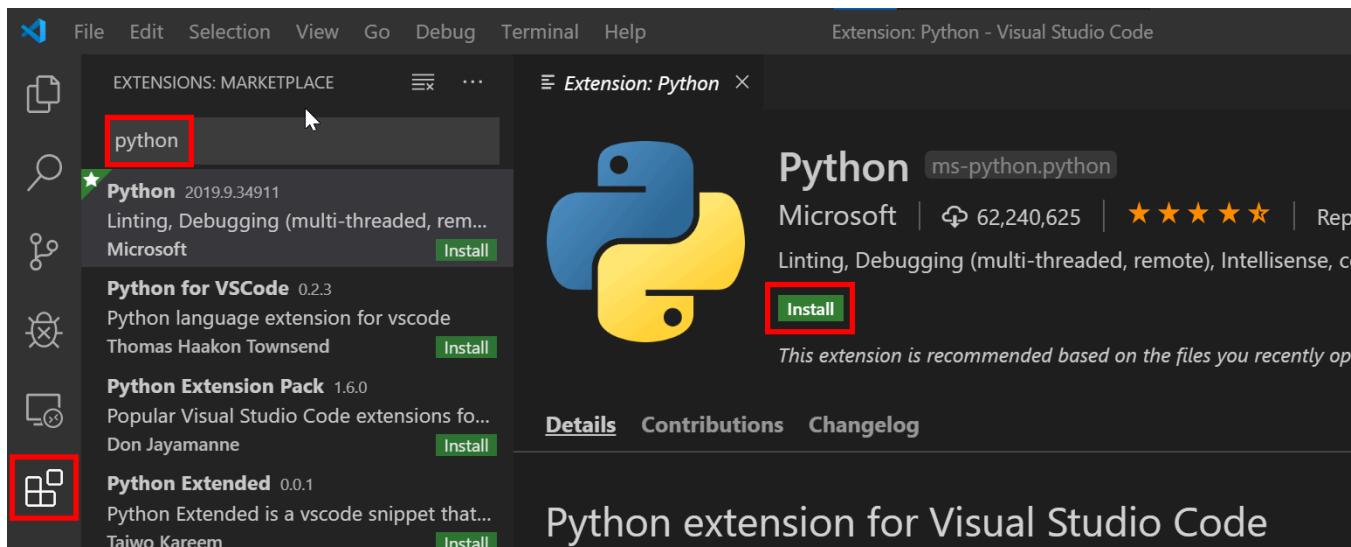

The features that Visual Studio Code includes out-of-the-box are just the start. VS Code extensions let you add languages, debuggers, and tools to your installation to support your development workflow.

Browse for extensions

You can search and install extensions from within Visual Studio Code. Open the Extensions view from the Visual Studio Code main menu, select **View > Extensions** or by clicking on the Extensions icon in the **Activity Bar** on the side of Visual Studio Code.

This will show you a list of the most popular VS Code extensions on the [VS Code Marketplace](#).

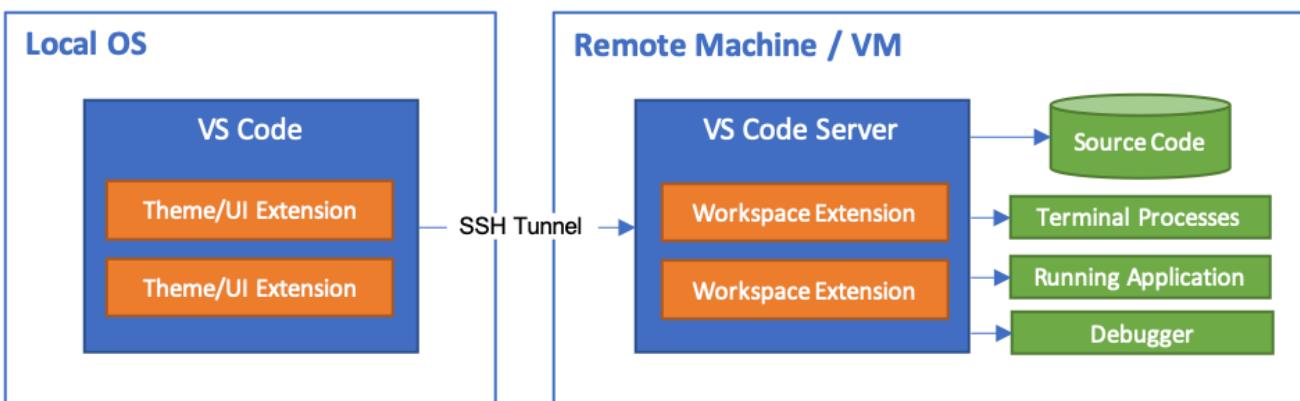

Install the Python, Remote SSH, and Docker Extensions

Search and install the following two Visual Studio Code Extensions published by Microsoft.

1. [Python](#)
2. [Remote - SSH](#)
3. [Docker Extension](#)

Remote SSH Development

The Visual Studio Code Remote - SSH extension allows you to open a remote folder on any remote machine, virtual machine, or container with a running SSH server and take full advantage of Visual Studio Code.

Raspberry Pi Hardware

You need the following information:

1. The **Network Address** of the Raspberry Pi
2. Your Raspberry Pi **login name** and **password**.

SSH Authentication with private/public keys

Setting up a public/private key pair for **SSH** authentication is a secure and fast way to authenticate from your computer to the Raspberry Pi. This is recommended for this hands-on lab.

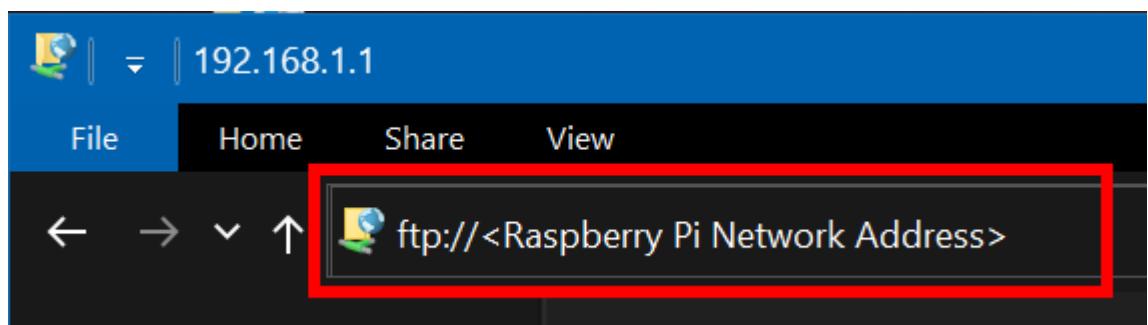

SSH Set up for Windows Users

The SSH utility guides you through the process of setting up a secure SSH channel for Visual Studio Code and the Raspberry Pi.

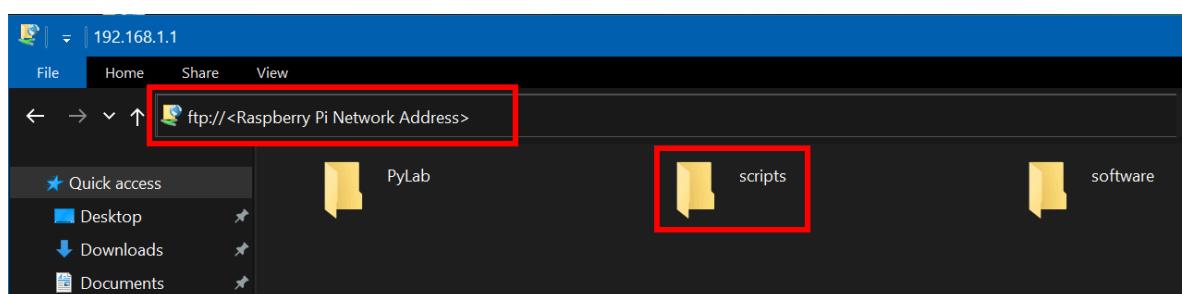

You will be prompted for:

- The Raspberry Pi Network IP Address,
- The Raspberry Pi login name and password

1. From **Windows File Explorer**, open **ftp://<Raspberry Pi Address>**

2. Copy the **scripts** directory to your **desktop**

3. Open the **scripts** folder you copied to your **desktop**
4. Double click the **windows-setup-ssh.cmd**

SSH Set up for Linux and macOS Users

The SSH utility guides you through the process of setting up a secure SSH channel for Visual Studio Code and the Raspberry Pi

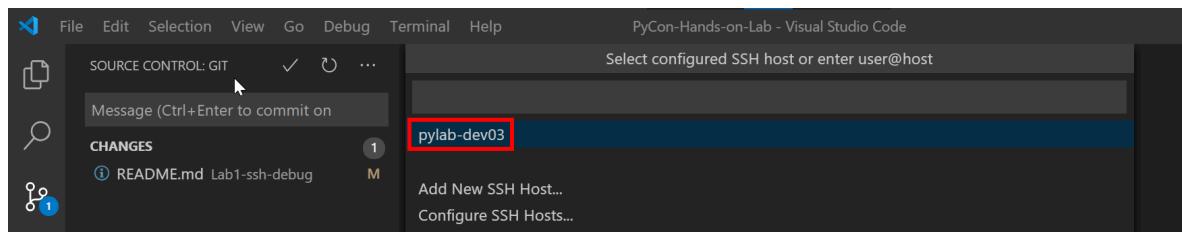

You will be prompted for:

- The Raspberry Pi Network IP Address,
 - The Raspberry Pi login name and password
1. Open a Terminal window
 2. Copy and paste the following command, and press **ENTER**

```
read -p "Enter the Raspberry Pi Address: " pyurl && \
curl ftp://$pyurl/scripts/ssh-setup.sh | bash
```

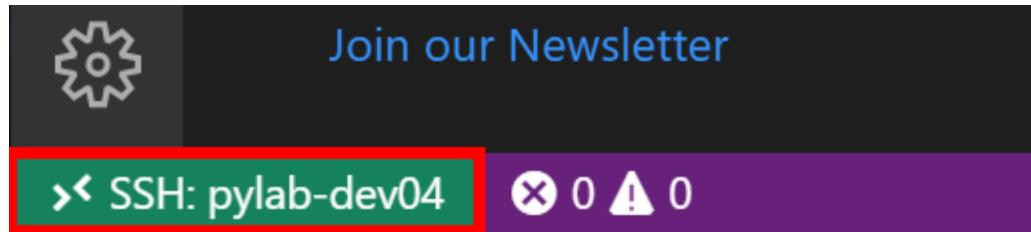

Start a Remote SSH Connection

1. **Start Visual Studio Code**
2. Press **F1** to open the Command Palette, type **ssh connect** and select **Remote-SSH: Connect to Host**
3. Select the **pylab-devnn** configuration

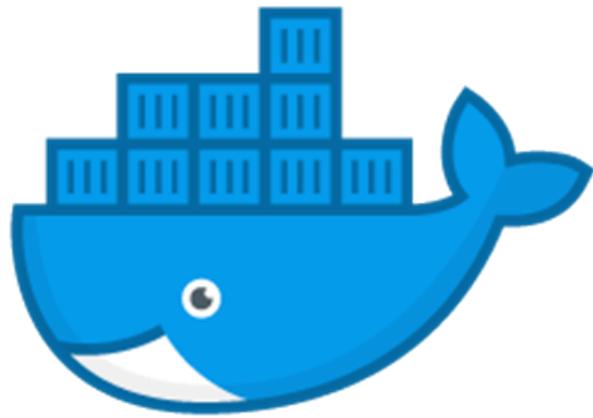

4. Check the Remote SSH has connected.

It will take a moment to connect, then the SSH Status in the bottom lefthand corner of Visual Studio Code will change to **>< SSH:pylab-devnn**. Where devnn is your Raspberry Pi Login name.

Introduction to Docker

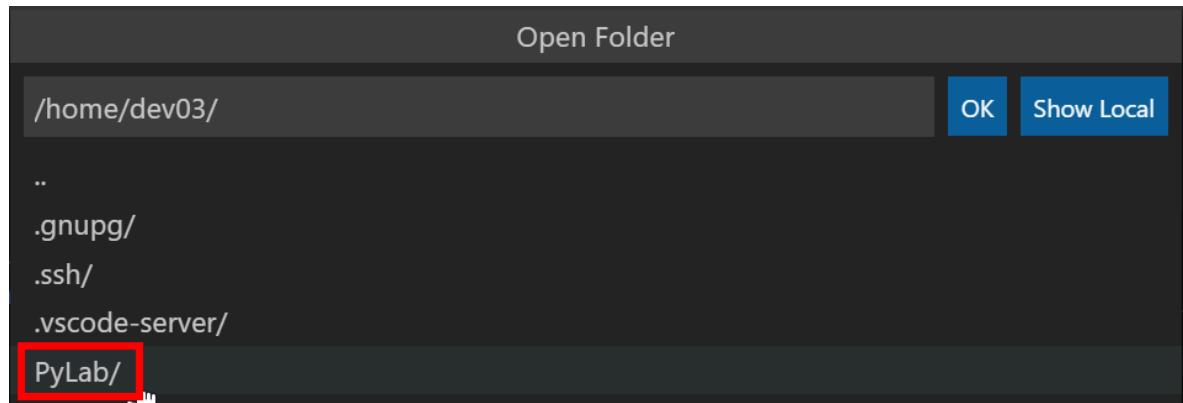

[Jake Wright's Docker in 12 Minutes](#) is a great introduction to Docker.

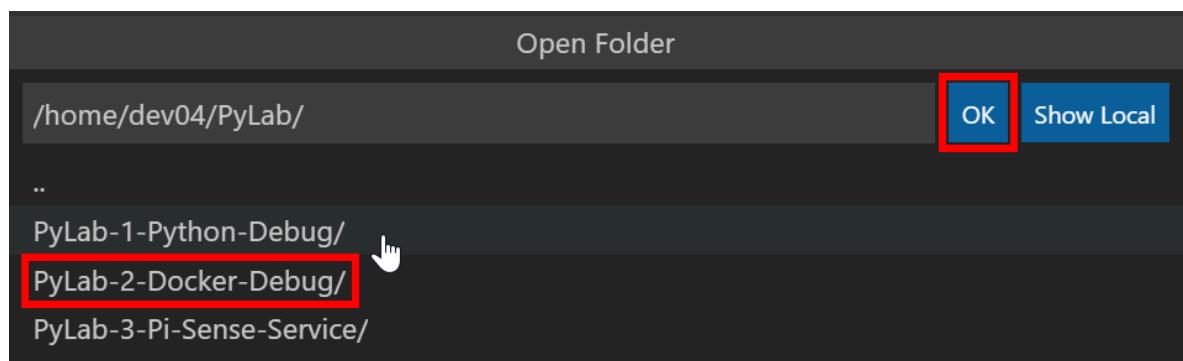

docker

Open the PyLab 2 Docker Debug Project

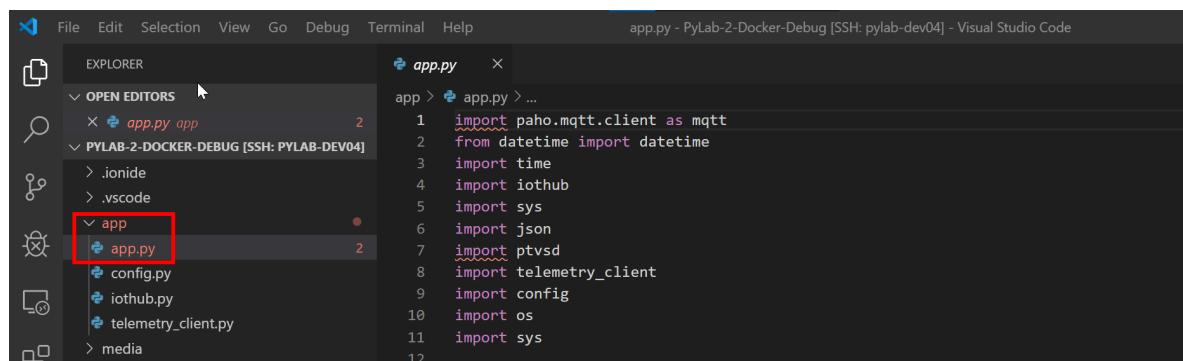

1. From Visual Studio Code main menu: **File > Open Folder**
2. Select the **PyLab** directory

3. Next select, the **PyLab-2-Docker-Debug/** directory

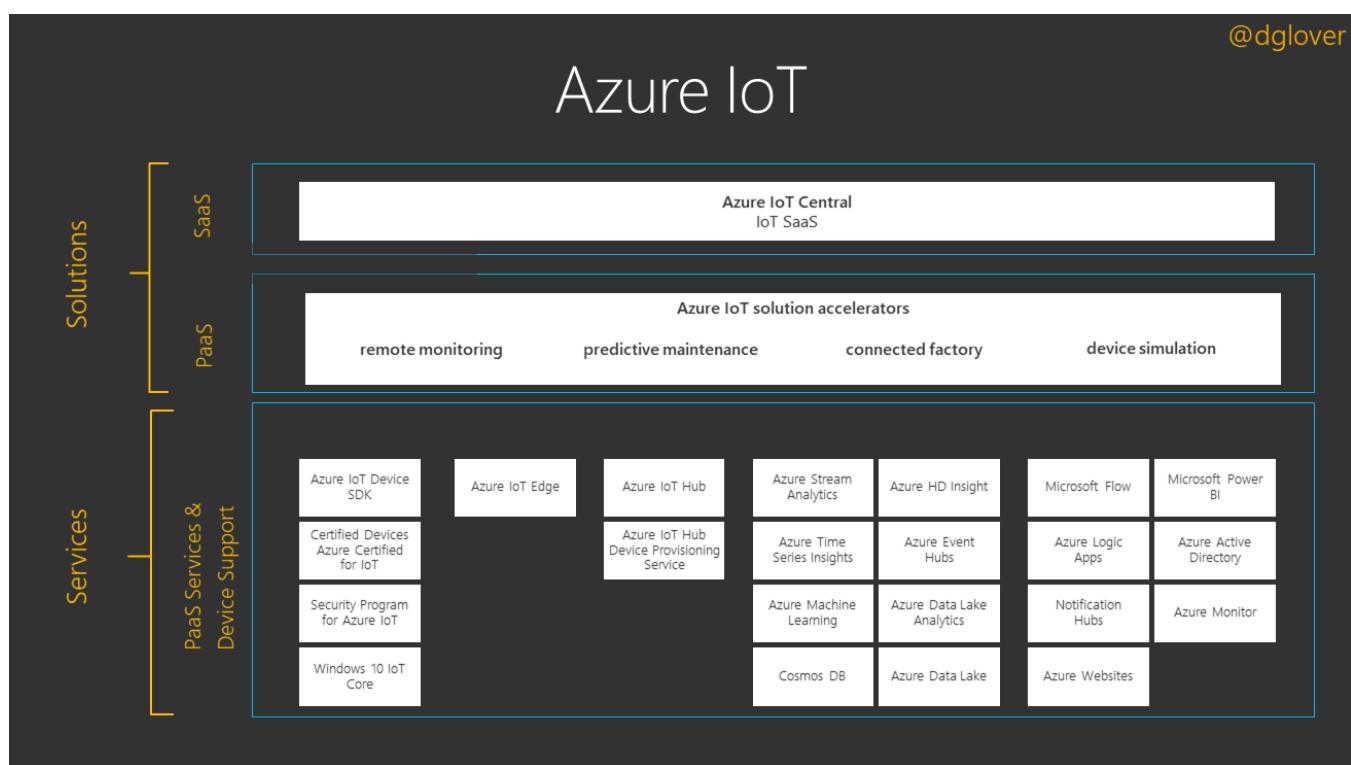

4. Click **OK** to Open the directory
5. From the **Explorer** bar, open the **app** folder, then the **app.py** file, and review the contents

Creating an Azure IoT Central Application

What is Azure IoT Central

Easily connect, monitor and manage your Internet of Things (IoT) assets at scale. [Azure IoT Central](#) is a hosted, extensible software as a service (SaaS) platform that simplifies setup of your IoT solution and helps reduce the burden and costs of IoT management, operations and development. Provide customers superior products and service while expanding your business possibilities.

We are going to create an Azure IoT Central application, then a device, and finally a device **connection string** needed for the application that will run in the Docker container.

Create a New IoT Central Application

1. Open the [Azure IoT Central](#) in a new browser tab, then click **Getting started**.
2. Next, you will need to sign with your **Microsoft** Personal, or Work, or School account. If you do not have a Microsoft account, then you can create one for free using the **Create one!** link.

Sign in

to continue to Azure IoT Central

Email, phone, or Skype

[Can't access your account?](#)

No account? [Create one!](#)

Next

3. Create a new Azure IoT Central application, select **New Application**. This takes you to the **Create Application** page.
4. Select **Trail, Custom application**, name your IoT Central application and complete the sign-up information.

Choose a payment plan

Trial

Free trial for 7 days. No subscription required.

Pay-As-You-Go

Price is based on the number of devices you use.
Free for the first 5 devices. Subscription
required. [Learn more ↗](#)

Select an application template

Sample Contoso

Get started with a predefined
application for a connected
device.

Sample Devkits

Want to connect a Raspberry
PI or MXChip IoT DevKit? Start
with this predefined app and
get them connected in
minutes.

Custom application

Start with a blank template and
define your application from
scratch.

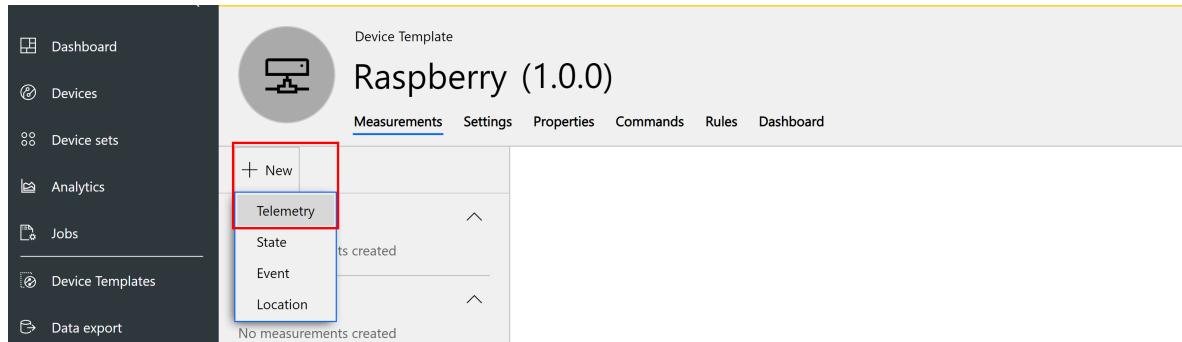

4. Click **Create Device Templates**, then select the **Custom** template, name your template, for example, **Raspberry**. Then click Create

The screenshot shows the Azure IoT Central dashboard. On the left, a dark sidebar menu lists options: Dashboard, Devices, Device sets, Analytics, Jobs, Device Templates (which is currently selected), Data export, and Administration. The main content area is titled 'Dashboard'. It features several cards: a large green card at the top labeled 'Create Device Templates' with a sub-description 'Device templates are blueprints that describe your devices.'; a 'Quick Start Demo' card with a description 'Learn how to use Azure IoT Central in minutes.'; a 'Documentation' card with a description 'Create new IoT business opportunities for your organization.'; and a 'Tutorials' card with a description 'Take easy steps to achieve your connected product vision.' A yellow banner at the top of the main area states 'Your trial is expiring in 7 days. You can convert to Pay-As-You-Go.'

5. Edit the Template, add **Measurements** for **Temperature**, **Humidity**, and **Pressure** telemetry.

Measurements are the data that comes from your device. You can add multiple measurements to your device template to match the capabilities of your device.

- **Telemetry** measurements are the numerical data points that your device collects over time. They're represented as a continuous stream. An example is temperature.
- **Event** measurements are point-in-time data that represents something of significance on the device. A severity level represents the importance of an event. An example is a fan motor error.
- **State** measurements represent the state of the device or its components over a period of time. For example, a fan mode can be defined as having Operating and Stopped as the two possible states.
- **Location** measurements are the longitude and latitude coordinates of the device over a period of time in. For example, a fan can be moved from one location to another.

Use the information in the following table to set up three telemetry measurements.

The field name is case-sensitive.

You **must** click **Save** after each measurement is defined.

Display Name	Field name	Units	Minimum	Maximum	Decimals
Humidity	Humidity	%	0	100	0
Temperature	Temperature	degC	-10	60	0
Pressure	Pressure	hPa	800	1260	0

The following is an example of setting up the **Temperature** telemetry

measurement.

The screenshot shows the IoT Central interface for creating a device template. The left sidebar has 'Devices' selected. The main area shows a 'Device Template' for 'Raspberry (1.0.0)'. The 'Measurements' tab is active. A 'Create Telemetry' dialog is open, prompting for a display name ('Temperature'), field name ('Temperature'), units ('degC'), minimum value ('-10'), maximum value ('60'), decimal places ('0'), and color ('red'). A 'Save' button is highlighted with a red box. To the right, a line chart displays simulated temperature data over time, showing a red line fluctuating between -10 and 60 degrees Celsius.

6. Click **Device** on the sidebar menu, select the **Raspberry** template you created. IoT central supports real devices, such as the Raspberry Pi used for this lab, as well as simulated devices which generate random data useful for system testing.
7. Select **Real**.

The screenshot shows the IoT Central 'Devices' page. The left sidebar has 'Devices' selected. The main area shows a table of devices. Under 'Templates', 'Raspberry (1.0.0)' is selected. A table shows '1 device' named 'Raspberry-1 (Simulated)'. A dropdown menu next to the device row has 'Real' selected, highlighted with a red box. Other options in the menu include 'Simulated' and 'Device Simulated' (set to Yes) and 'Provisioning Status' (set to N/A).

Name your **Device ID** so you can easily identify the device in the IoT Central portal, then click **Create**.

Create New Device

Device ID * ⓘ

↻ 📄

Device Name ⓘ

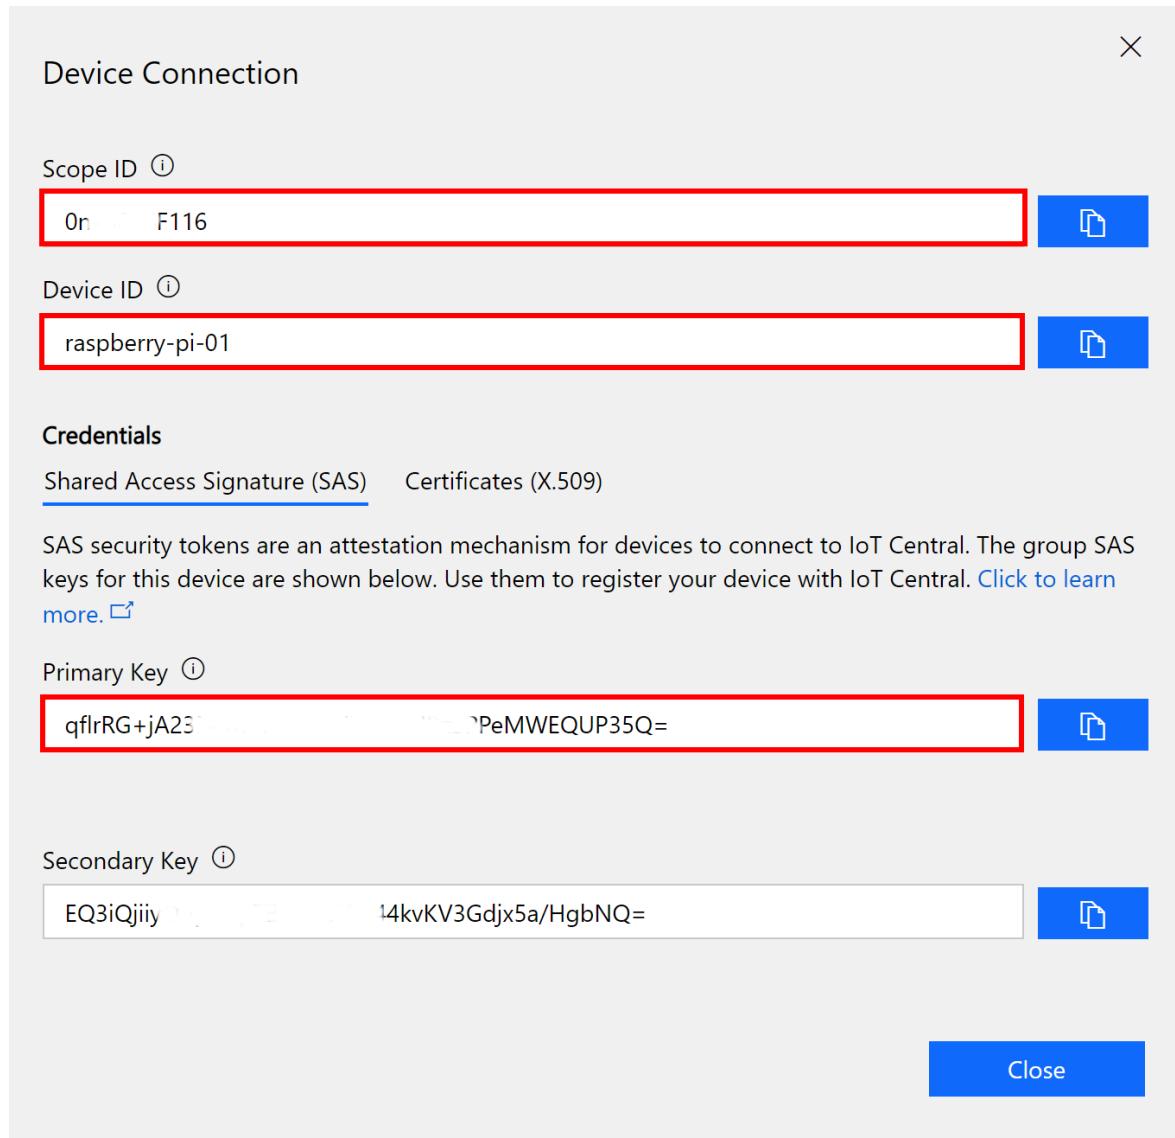

↻ 📄

Create Cancel

- When you have created your real device click the **Connect** button in the top right-hand corner of the screen to display the device credentials.

The screenshot shows the Azure IoT Application interface. On the left is a navigation sidebar with options: Dashboard, Devices, Device sets, Analytics, Jobs, and Device Templates. The main area is titled 'Device' and shows a card for 'Raspberry - raspberry-pi-01'. The card includes tabs for Measurements, Settings, Properties, Commands, Rules, and Dashboard. Below the card, there's a section for 'Telemetry' with a single entry: 'Temperature AVERAGE'. At the top right of the card, there are three buttons: 'Block', 'Connect' (which is highlighted with a red box), and 'Delete'. To the right of the card, it says 'Status: Registered'. At the very top of the page is a search bar and some global navigation icons.

Leave this page open as you will need this connection information for the next step in the hands-on lab.

Generate an Azure IoT Hub Connection String

1. Hold the control key down and click the following link [Connection String Generator](#) to open in a new tab.
Copy and paste the **Scope Id**, **Device Id**, and the **Primary Key** from the Azure IoT Central Device Connection panel to the Connection String Generator page and click **Get Connection String**.

Azure IoT Central Connection String Generator

Scope	One Device
Device Id	my-device
Device Key	UzztjO...aszy5RAn/j+bSEfEjBW7w3V145Ip/c=

[Get Connection String](#)

2. Copy the generated connection string to the clipboard as you will need it for the next step.

Configure the Python Application

1. Switch back to Visual Studio Code. Open the **env-file** (environment file). This file contains environment variables that will be passed to the Docker container.
2. Paste the connection string you copied in the previous step into the env-file on the same line, and after **CONNECTION_STRING=**.

For example:

```
CONNECTION_STRING=HostName=saaS-iothub-8135cd3b....
```

3. Save the env-file file (Ctrl+S)

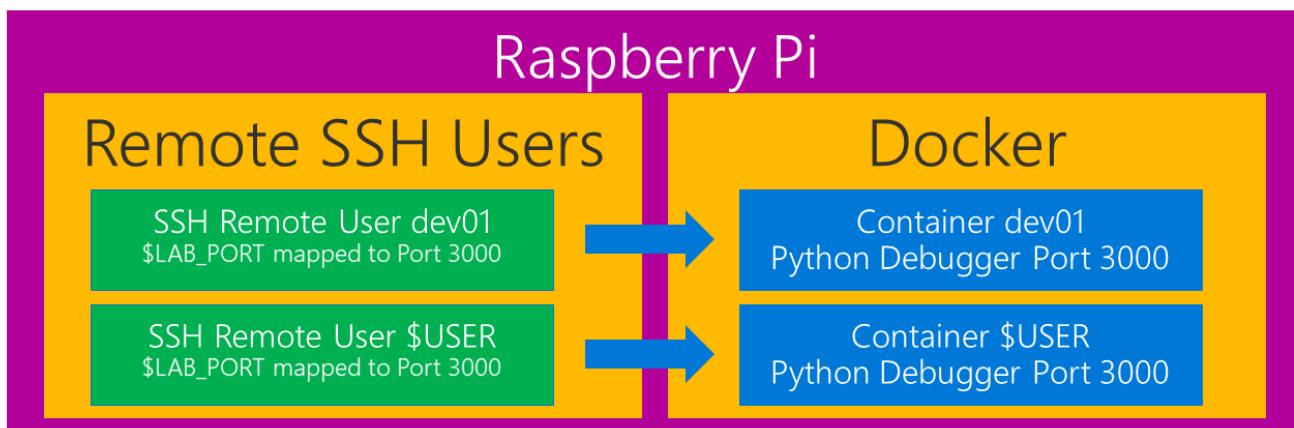

How Debugging a Python App in a Docker Container Works

- Each User Profile (\$USER) has a Unique (\$LAB_PORT) Environment Variable that is set when you log into the Raspberry Pi (.bashrc).
- The follow happens when you start a Visual Studio Code Docker container debug session:
 1. A Docker container named \$USER is built to include your Python Code (docker build)
 2. Docker maps \$LAB_PORT to Port 3000 in the container (-p \$LAB_PORT:3000).
If you review the **.vscode/task.json** file you will see the Docker commands that run when you start the debugger.
 3. The Docker Container is started (docker run -p \$LAB_PORT:3000)
 4. One of the first lines of code in the **app.py** file is to start the *ptvsd*

(Python Tools for Visual Studio Debugger) debugger to listen on port 3000.

```
ptvsd.enable_attach(address='0.0.0.0', 3000)
```

5. Next the Visual Studio Code debugger attaches to \$LAB_PORT that is mapped through to port 3000. This is the port that the Visual Studio Python Debugger is listening on in the container. Review the **.vscode/launch.json** file to understand how the debugger attach works.
6. Now you can start stepping through the Python code, set breakpoints, inspect variables etc.

Build and Run the Docker Image

Press **F5** to start debugging the Python application. The process will first build and then start the Docker Container. When the Docker Container has started the Visual Studio Code Debugger will attach to the running application.

There are two configuration files found in the **.vscode** folder that are responsible for running and debugging the Python application. You can find more detail the [Debugger Configuration](#) appendix.

Set a Visual Studio Debugger Breakpoint

1. From **Explorer** on the Visual Studio Code activity bar, open the **app.py** file
2. Set a breakpoint at line 66, **temperature, pressure, humidity, timestamp = mysensor.measure()** in the **publish** function.

- You can set a breakpoint by doing any one of the following:
 - With the cursor on that line, press F9, or,
 - With the cursor on that line, select the Debug > Toggle Breakpoint menu command, or, click directly in the margin to the left of the line number (a faded red dot appears when hovering there). The breakpoint appears as a red dot in the left margin:

```

62  def publish():
63      msgId = 1
64      while True:
65          try:
66              temperature, pressure, humidity, timestamp, cpu_temperature = mysensor.measure()
67
68              data = {
69                  "Geo": 'Sydney, AU',
70                  "Humidity": humidity,
71                  "Pressure": pressure,
72                  "Temperature": temperature,
73                  "CpuTemperature": cpu_temperature,
74                  "Epoch": timestamp,
75                  "Id": msgId
76
77

```

Debug actions

Once a debug session starts, the **Debug toolbar** will appear at the top of the editor window.

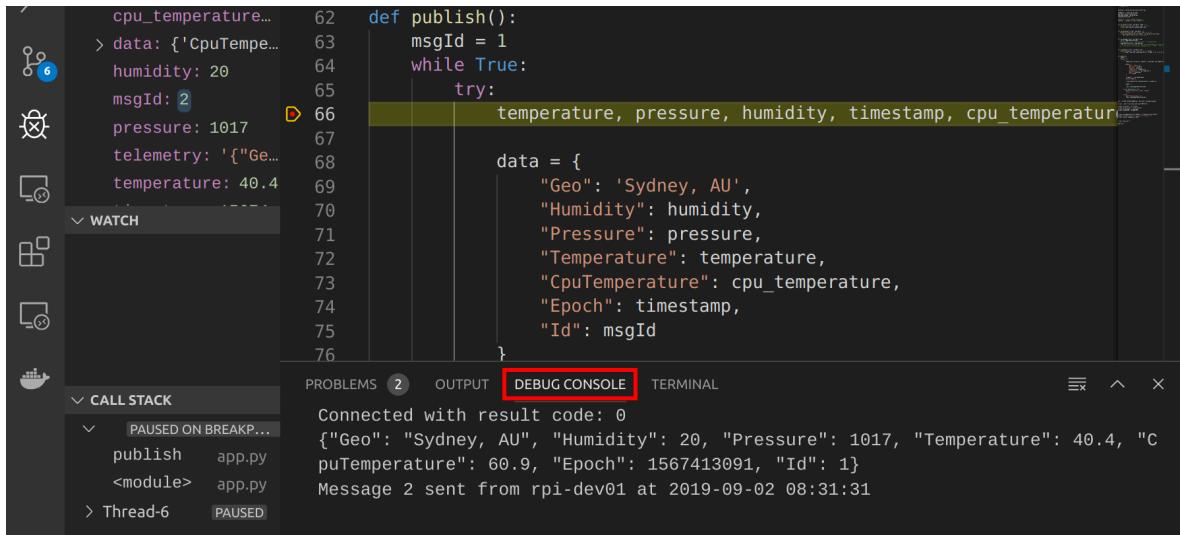

The debugger toolbar (shown above) will appear in Visual Studio Code. It has the following options:

1. Pause (or Continue, F5),
2. Step Over (F10)
3. Step Into (F11),
4. Step Out (Shift+F11),
5. Restart (Ctrl+Shift+F5),
6. and Stop (Shift+F5).

Step through the Python code

1. Press **F10**, or from the Debugger Toolbar, click **Step Over** until you are past the **print(telemetry)** line of code.
2. Explore the **Variable Window** (Ctrl+Shift+Y). Try changing variable values.

3. Explore the **Debug Console**. You will see sensor telemetry and the results of sending the telemetry to Azure IoT Central.

```

cpu_temperature... 62 def publish():
> data: {'CpuTempe... 63     msgId = 1
humidity: 20 64     while True:
msgId: 2 65         try:
pressure: 1017 66             temperature, pressure, humidity, timestamp, cpu_temperature
telemetry: '{"Ge... 67                 data = {
temperature: 40.4 68                     "Geo": 'Sydney, AU',
70                         "Humidity": humidity,
71                         "Pressure": pressure,
72                         "Temperature": temperature,
73                         "CpuTemperature": cpu_temperature,
74                         "Epoch": timestamp,
75                         "Id": msgId
76             }
    
```

PROBLEMS 2 OUTPUT DEBUG CONSOLE TERMINAL

Connected with result code: 0

{"Geo": "Sydney, AU", "Humidity": 20, "Pressure": 1017, "Temperature": 40.4, "CpuTemperature": 60.9, "Epoch": 1567413091, "Id": 1}

Message 2 sent from rpi-dev01 at 2019-09-02 08:31:31

CALL STACK PAUSED ON BREAKPOINT...

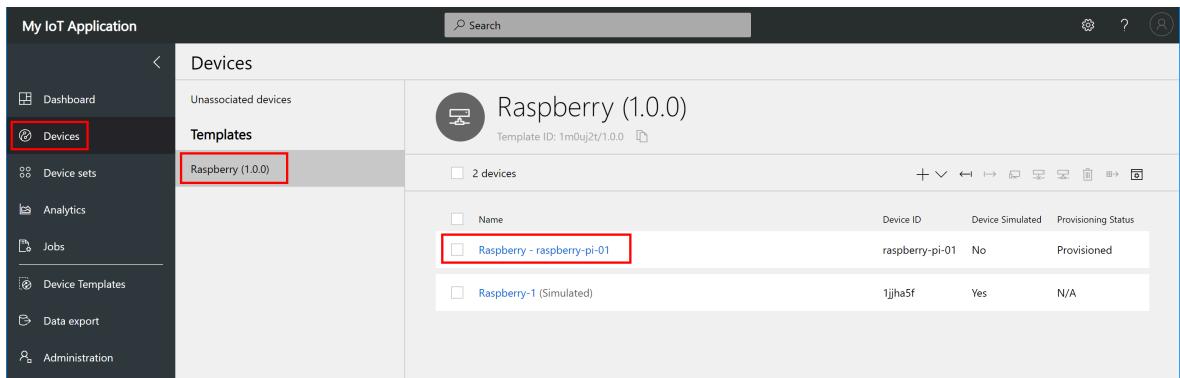

publish app.py <module> app.py

> Thread-6 PAUSED

4. From the **Debug Menu** -> **Disable All Breakpoints**
5. Press **F5** or from the Debugger Toolbar, click **Continue** so the Python application runs and streams telemetry to **Azure IoT Central**.

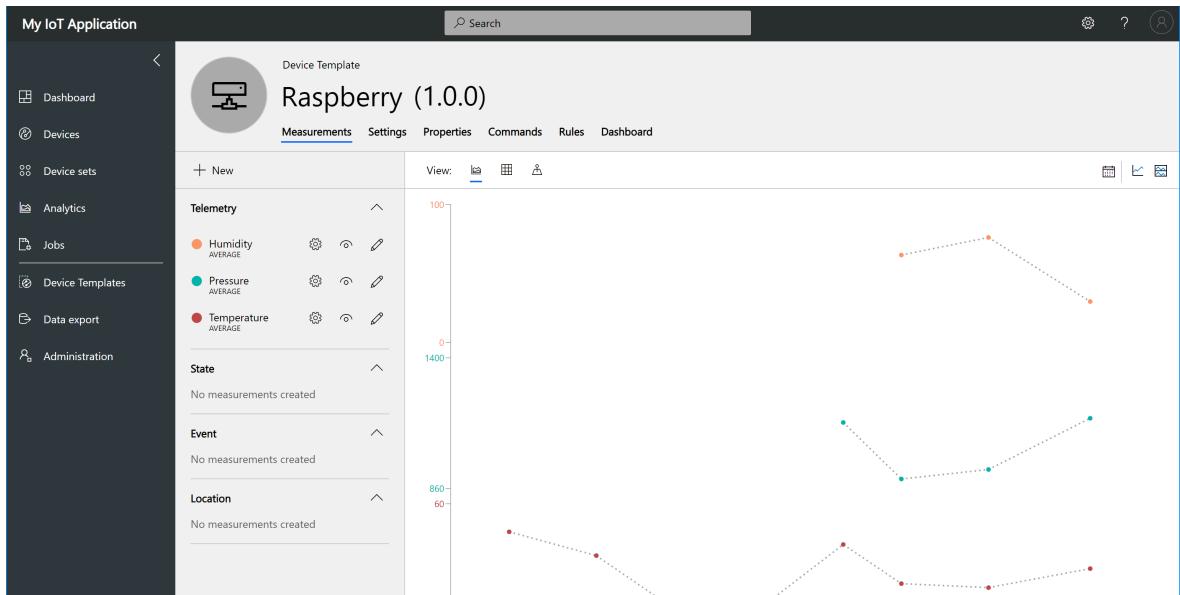

Exploring Device Telemetry in Azure IoT Central

1. Use **Device** to navigate to the **Measurements** page for the real Raspberry Pi device you added:

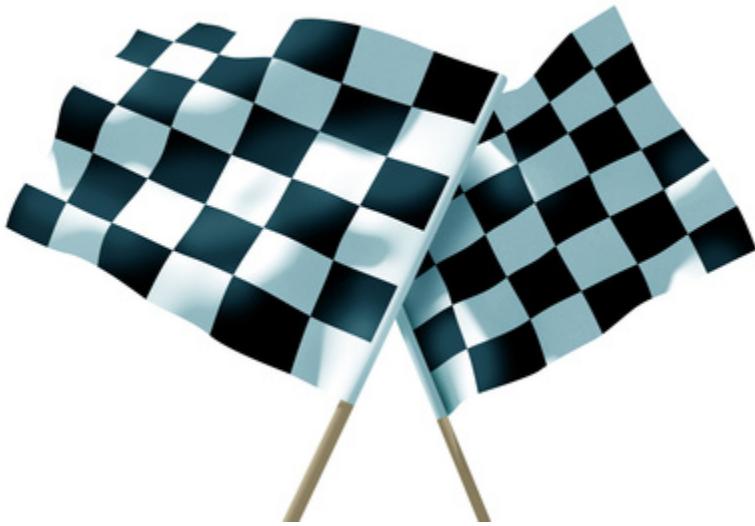

Name	Device ID	Device Simulated	Provisioning Status
Raspberry - raspberry-pi-01	raspberry-pi-01	No	Provisioned
Raspberry-1 (Simulated)	1jjha5f	Yes	N/A

2. On the **Measurements** page, you can see the telemetry streaming from the Raspberry Pi device:

Finished

Appendix

Debugger Configuration

There are two files (`launch.json` and `tasks.json`) found in the `.vscode` folder that are responsible for the running and debugging the application.

Launch Configuration

Creating a launch configuration file is useful as it allows you to configure and save debugging setup details.

launch.json

```
{
    // Use IntelliSense to learn about possible attributes.
    // Hover to view descriptions of existing attributes.
    // For more information, visit: https://go.microsoft.com/fwlink/?linkid=830387
    "version": "0.2.0",
    "configurations": [
        {
            "name": "Attach Debugger",
            "preLaunchTask": "start-docker",
            "postDebugTask": "stop-docker",
            "type": "python",
            "request": "attach",
            "pathMappings": [
                {
                    "localRoot": "${workspaceRoot}/app",
                    "remoteRoot": "/app"
                }
            ],
            "port": "${env:LAB_PORT}",
            "host": "localhost"
        },
        {
            "name": "Stop Container",
            "preLaunchTask": "stop-docker",
            "type": "python",
            "request": "launch"
        }
    ]
}
```

Tasks Configuration

Tasks integrate external tools to automate build cycle.

tasks.json

```
{
    // See https://go.microsoft.com/fwlink/?LinkId=733558
    // for the documentation about the tasks.json format
    "version": "2.0.0",
    "tasks": [
        {
            "label": "start-docker",
            "type": "shell",
            "command": "sh",
            "args": [
                "-c",
                "\"docker build -t $USER:latest . ; docker run -d -p $LAB_PORT:3000 -e TElemetry_Host=$HOST_IP\"",
                // -d Run container in background and print container ID,
                // -p maps the $LAB_PORT to port 3000 in the container, this port is used for debugging
                // -e Environment Variable. The IP Address of the telemetry service.
                // --env-file reads from a file and sets Environment Variables in the Docker Container
                // --name names the Docker Container
                // --rm removes the container when you stop it
                // Docker run reference https://docs.docker.com/engine/reference/run/"
            ],
        },
        {
            "label": "stop-docker",
            "type": "shell",
            "command": "sh",
            "args": [
                "-c",
                "\"docker stop $USER\""
            ]
        }
    ]
}
```

Azure IoT Central

Take a tour of the Azure IoT Central UI

This article introduces you to the Microsoft Azure IoT Central UI. You can use the UI to create, manage, and use an Azure IoT Central solution and its connected devices.

As a *builder*, you use the Azure IoT Central UI to define your Azure IoT Central solution. You can use the UI to:

- Define the types of device that connect to your solution.

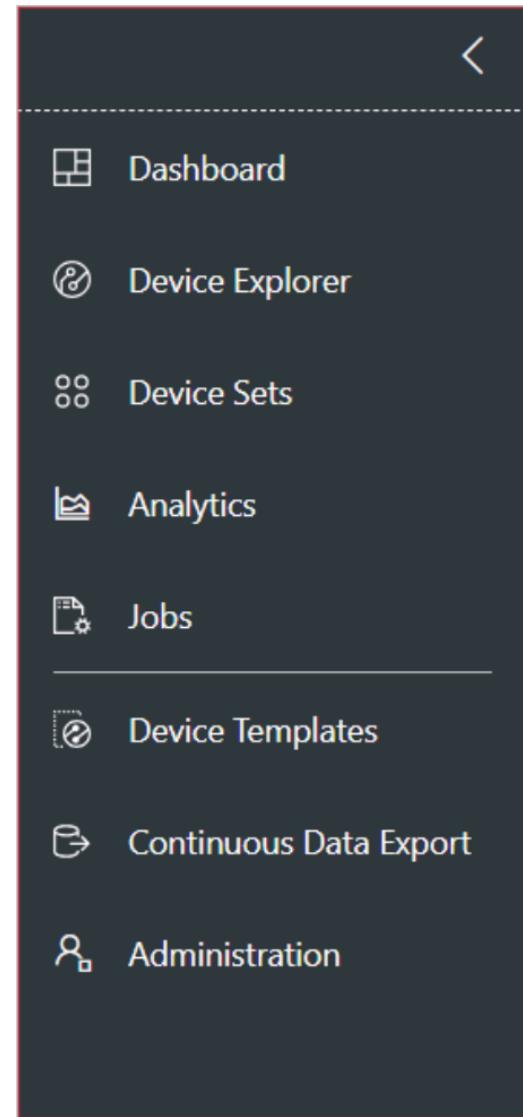

- Configure the rules and actions for your devices.
- Customize the UI for an *operator* who uses your solution.

As an *operator*, you use the Azure IoT Central UI to manage your Azure IoT Central solution. You can use the UI to:

- Monitor your devices.
- Configure your devices.
- Troubleshoot and remediate issues with your devices.
- Provision new devices.

Use the left navigation menu

Use the left navigation menu to access the different areas of the application. You can expand or collapse the navigation bar by selecting < or >:

Menu	Description
	<ul style="list-style-type: none"> The Dashboard button displays your application dashboard. As a builder, you can customize the dashboard for your operators. Users can also create their own dashboards. The Device Explorer button lists the simulated and real devices associated with each device template in the application. As an operator, you use the Device Explorer to manage your connected devices. The Device Sets button enables you to view and create device sets. As an operator, you can create device sets as a logical collection of devices specified by a query. The Analytics button shows analytics derived from device telemetry for devices and device sets. As an operator, you can create custom views on top of device data to derive insights from your application. The Jobs button enables bulk device management by having you create and run jobs to perform updates at scale. The Device Templates button shows the tools a builder uses to create and manage device templates. The Continuous Data Export button an administrator to configure a continuous export to other Azure services such as storage and queues. The Administration button shows the application administration pages where an administrator can manage application settings, users, and roles.

Search, help, and support

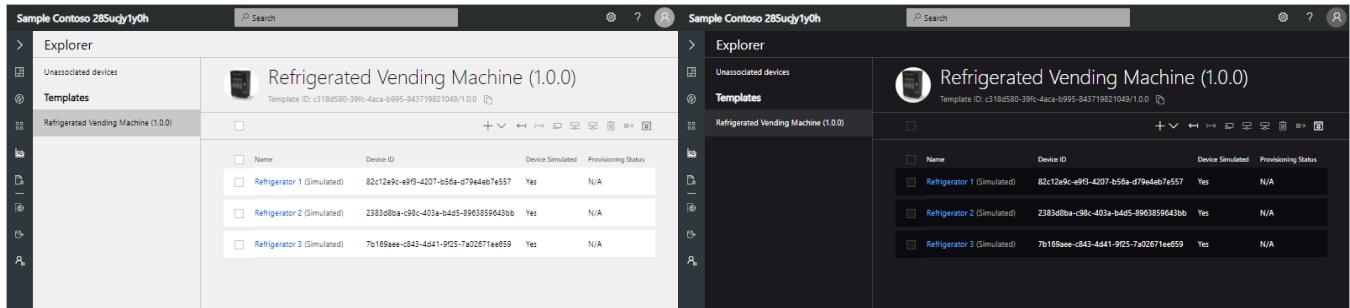

The top menu appears on every page:

- To search for device templates and devices, enter a **Search** value.
- To change the UI language or theme, choose the **Settings** icon.
- To sign out of the application, choose the **Account** icon.
- To get help and support, choose the **Help** drop-down for a list of resources. In a

trial application, the support resources include access to [live chat](#).

You can choose between a light theme or a dark theme for the UI:

Dashboard

The image shows the Azure IoT Central dashboard. On the left is a dark sidebar menu with options: Dashboard (which is selected and highlighted with a red box), Device Explorer, Device Sets, Analytics, Jobs, Device Templates, Continuous Data Export, and Administration. The main area is titled 'Dashboard' and features a large central banner with the text 'Azure IoT Central' and a hexagonal icon. Below the banner are three cards: 'Raspberry Pi' (with an image of a Raspberry Pi board), 'MXChip Developer Kit' (with an image of the MXChip DevKit), and 'Windows' (with an image of a Windows board). Each card has a brief description below it.

The dashboard is the first page you see when you sign in to your Azure IoT Central application. As a builder, you can customize the application dashboard for other users by adding tiles. To learn more, see the [Customize the Azure IoT Central operator's view](#) tutorial. Users can also [create their own personal dashboards](#).

Device explorer

The screenshot shows the Azure IoT Central Device Explorer interface. The left sidebar has a red box around the 'Device Explorer' item. The main area is titled 'Explorer' and shows 'Unassociated devices' and 'Templates'. Under 'Templates', 'MXChip (1.0.0)' is selected, shown with a thumbnail icon and its template ID. Below it, there are other templates: 'Raspberry Pi (1.0.0)' and 'Windows 10 IoT Core (1.0.0)'. On the right, a table lists devices under 'MXChip (1.0.0)'. The table has columns for Name, Device ID, Device Simulated, and Provision. One row is shown: 'MXChip (Simulated)' with Device ID 'c383b62a-0372-4202-a1b4-7a26cdab5f65', 'Yes' under Device Simulated, and 'N/A' under Provision.

Name	Device ID	Device Simulated	Provision
MXChip (Simulated)	c383b62a-0372-4202-a1b4-7a26cdab5f65	Yes	N/A

The explorer page shows the *devices* in your Azure IoT Central application grouped by *device template*.

- A device template defines a type of device that can connect to your application. To learn more, see the [Define a new device type in your Azure IoT Central application](#).
- A device represents either a real or simulated device in your application. To learn more, see the [Add a new device to your Azure IoT Central application](#).

Device sets

Name	Description
MXChip (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.
MXChip manufactured in Seattle	Devices manufactured in Seattle
Raspberry Pi (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.
Windows 10 IoT Core (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.

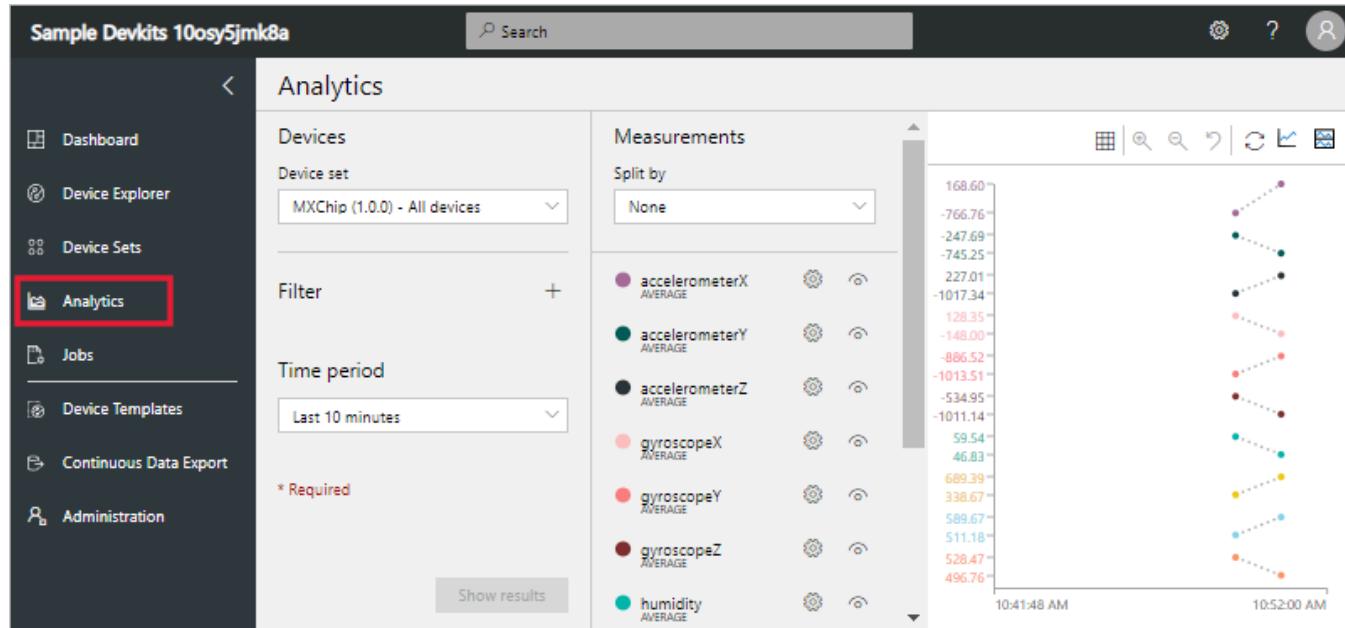

The *device sets* page shows device sets created by the builder. A device set is a collection of related devices. A builder defines a query to identify the devices that are included in a device set. You use device sets when you customize the analytics in your application. To learn more, see the [Use device sets in your Azure IoT Central application](#) article.

Device Templates

Name	Version	Devices
MXChip	1.0.0	1
Raspberry Pi	1.0.0	1
Windows 10 IoT Core	1.0.0	1

The device templates page is where a builder creates and manages the device templates in the application. To learn more, see the [Define a new device type in your Azure IoT Central application](#) tutorial.

Analytics

The analytics page shows charts that help you understand how the devices connected to your application are behaving. An operator uses this page to monitor and investigate issues with connected devices. The builder can define the charts shown on this page. To learn more, see the [Create custom analytics for your Azure IoT Central application](#) article.

Jobs

The screenshot shows the 'Jobs' page in IoT Central. The left sidebar has a red box around the 'Jobs' item. The main area shows a table with one job entry:

Name	Description	Date Started	Date Completed
Set Fan Speed	Completed - 1 succeeded, 0 failed	2/14/2019, 10:53:03 UTC	2/14/2019, 10:53:04 UTC

The jobs page allows you to perform bulk device management operations onto your devices. The builder uses this page to update device properties, settings, and commands. To learn more, see the [Run a job](#) article.

Continuous Data Export

The screenshot shows the 'Continuous Data Export' page in IoT Central. The left sidebar has a red box around the 'Continuous Data Export' item. The main area contains the following text:

Continuously export data from IoT Central to your Storage, Event Hubs, and Service Bus. Get started by creating an export. [Learn more](#)

The continuous data export page is where an administrator defines how to export data, such as telemetry, from the application. Other services can store the exported data or use it for analysis. To learn more, see the [Export your data in Azure IoT Central](#) article.

Administration

The screenshot shows the Azure IoT Central Administration page for the application "Sample Devkits 10osy5jmk8a". The left sidebar has a red box around the "Administration" item. The main content area is titled "Application Settings" and includes sections for "Save", "Application Image" (with a placeholder icon), "Application Name" (set to "Sample Devkits 10osy5jmk8a"), "Application URL" (set to "sample-devkits-10osy5jr" and "rainbowdash.azureiotcentral-dev.com"), and a "Copy Application" section with a "Copy" button.

The administration page contains links to the tools an administrator uses such as defining users and roles in the application. To learn more, see the [Administer your Azure IoT Central application](#) article.
